1. System upload is not recognizing Excel file types, I tried to add it at the beginning of document upload and in the review of the documents “Choose Files” and it would not let me.

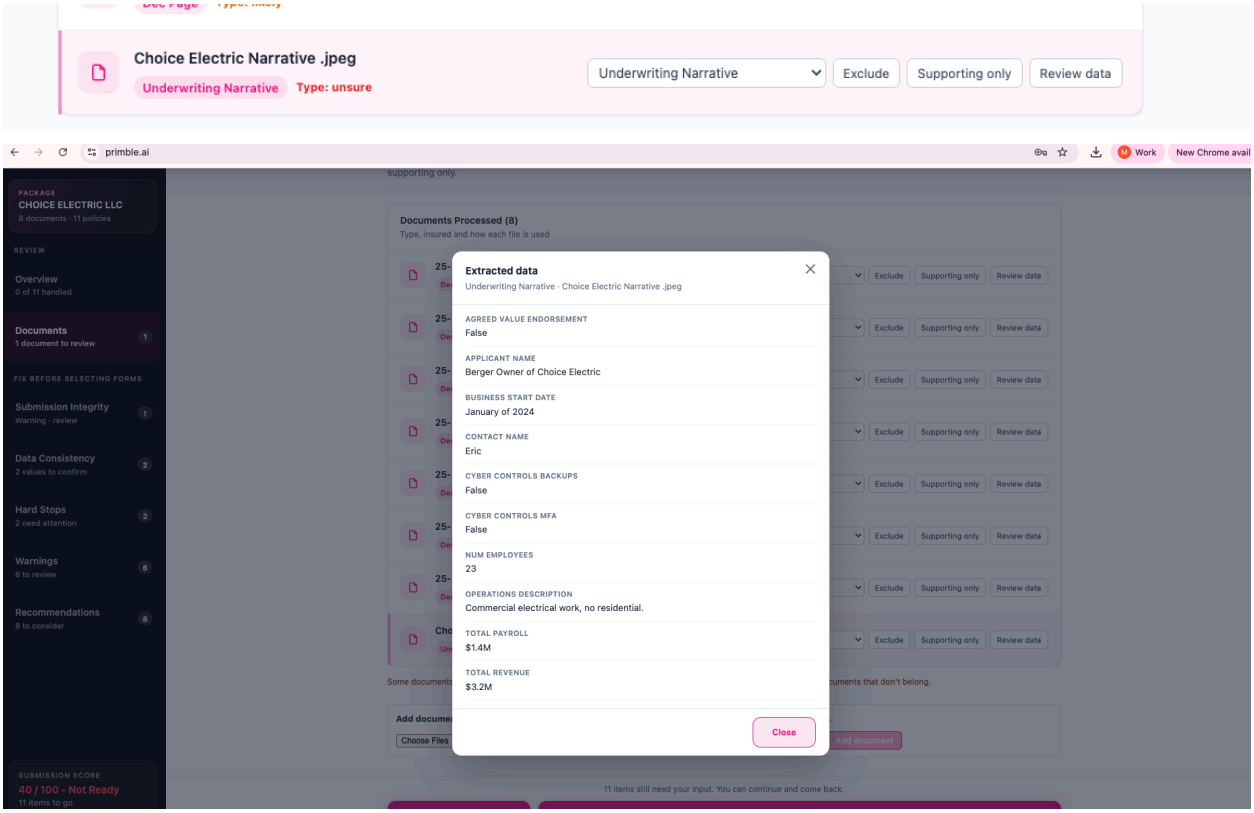

2. See below. Reposition to under title and change wording from: “Some documents need review. Set the correct type so scoring and form recommendations use them - or exclude documents that don't belong.”

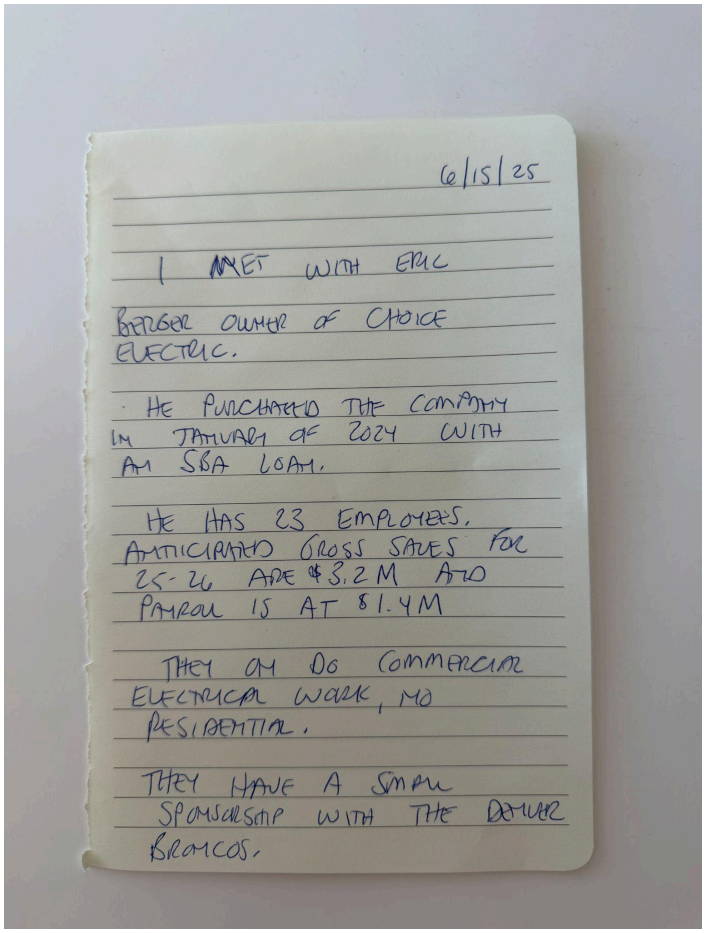

To this (in pink): “Some documents require review. Confirm their document type to ensure accurate scoring and form recommendations, or exclude any that don't belong in this submission.”

Current wording	Recommended wording	Meaning
Type: sure	Highly Confident	Primble has high confidence in its document classification.
Type: likely	Needs Verification	Primble has identified a probable document type, but confirmation is recommended.
Type: unsure	Unable to Classify	Primble cannot confidently identify the document type.

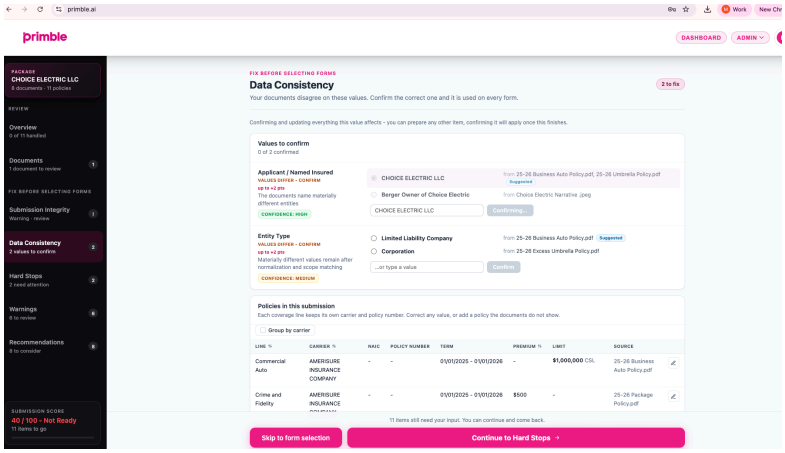

3. This is what comes up when I hit "review" on Choice Electric Narrative that I wrote by hand and saved as a .jpg. The screenshot shows Primble extracting useful details such as revenue, payroll, employee count and operations. However, it also mixes in fields like cyber controls and agreed value endorsements without showing whether they apply to the requested coverage. These should be coverage-specific questions.

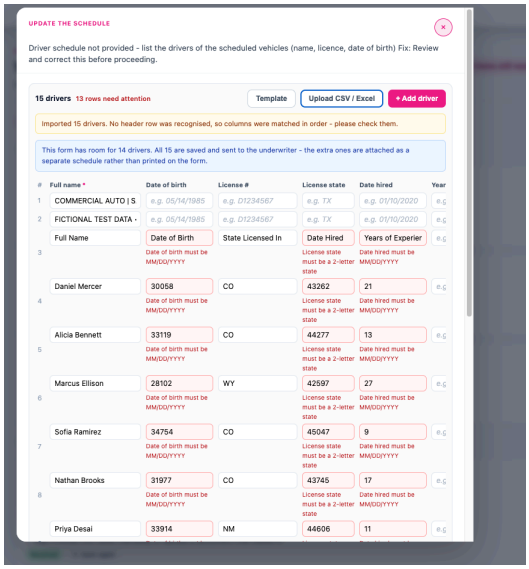

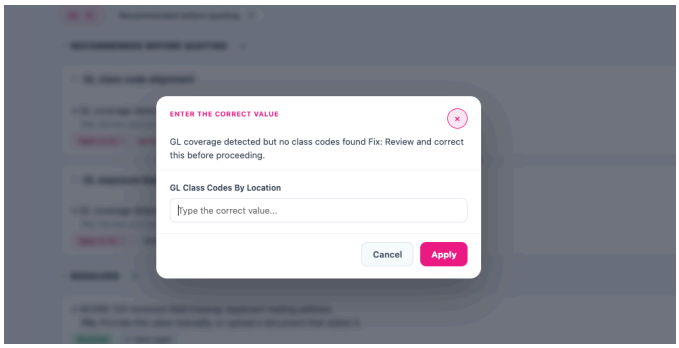

4. All I said in my narrative was Eric Berger is the owner, it should not come into question on the name of the company

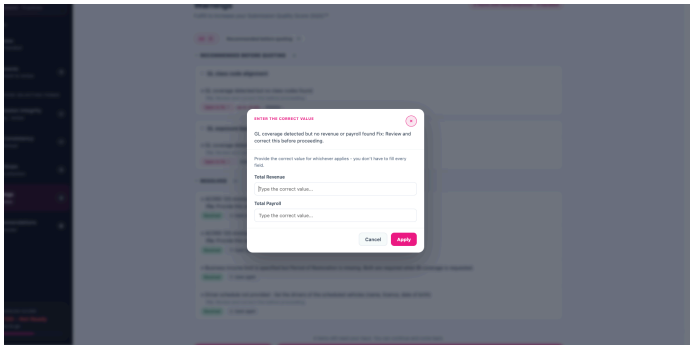

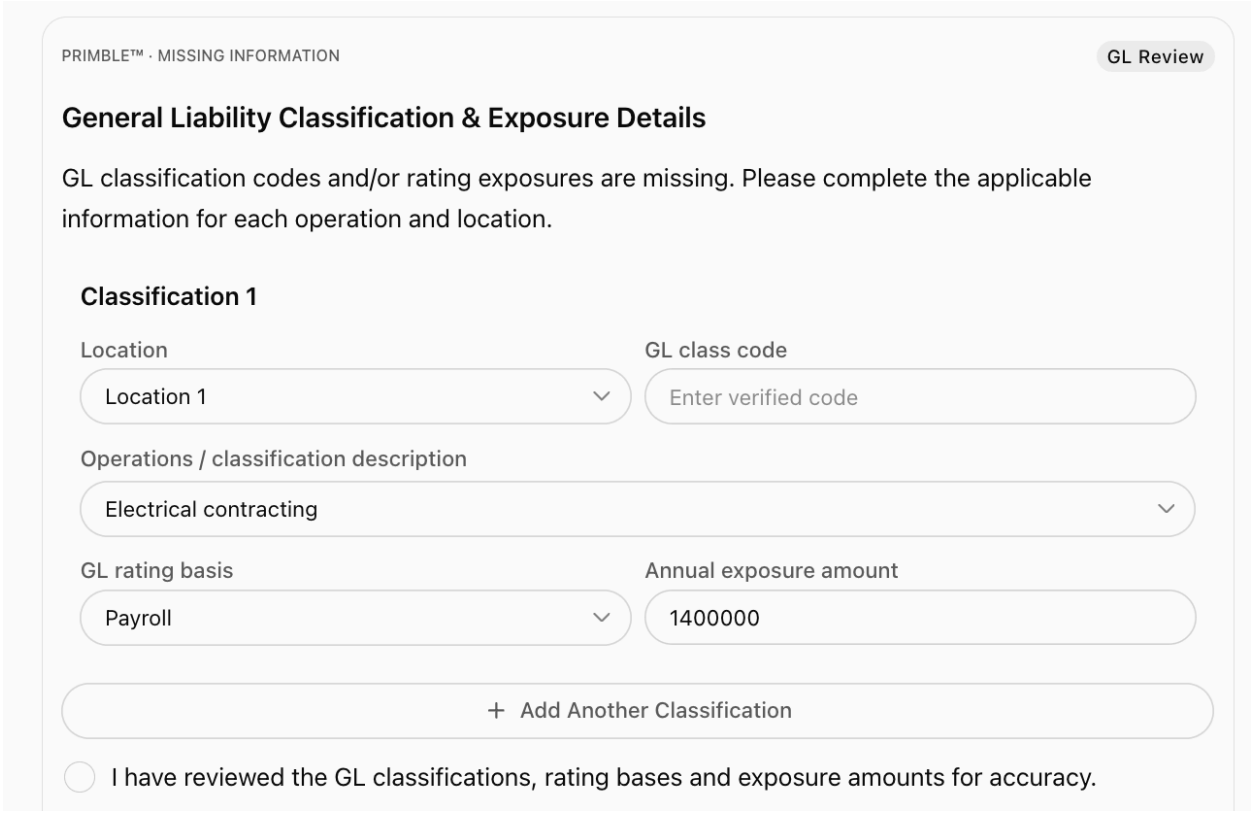

5. I tested uploading an Excel driver schedule, and the upload worked successfully. However, some of the information was incorrectly mapped to the required fields. I will provide the sample driver schedule separately so you can review the data mapping and correct the errors.

6. Instead of these two separate question boxes, we can combine them - see examples and explanation below:

Please combine the two existing GL pop-ups into one titled “General Liability Classification & Exposure Details.” The new pop-up should include these separate fields:

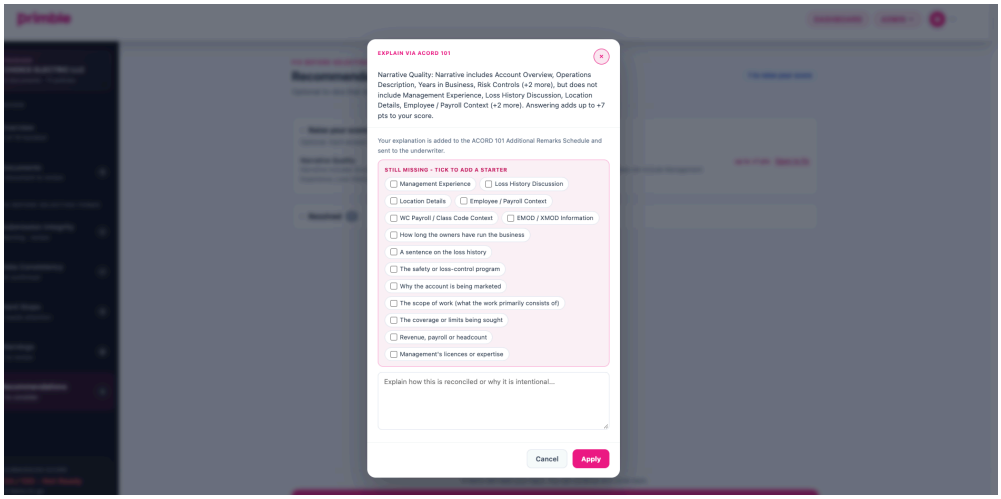

1. Location: Dropdown populated with the insured's locations.
2. GL Classification Description: Searchable dropdown with applicable operations, plus an Other option.
3. GL Class Code: Field for the verified GL classification code. Auto-populate only when verified against the applicable classification system.
4. GL Rating Basis: Dropdown for Payroll, Gross Sales, Subcontractor Cost, Area, or Other.

Annual Exposure Amount: Numeric field with the appropriate dollar or unit format based on the selected rating basis. Include an “Add Another Classification” button for accounts with multiple operations or locations.
Important functionality:

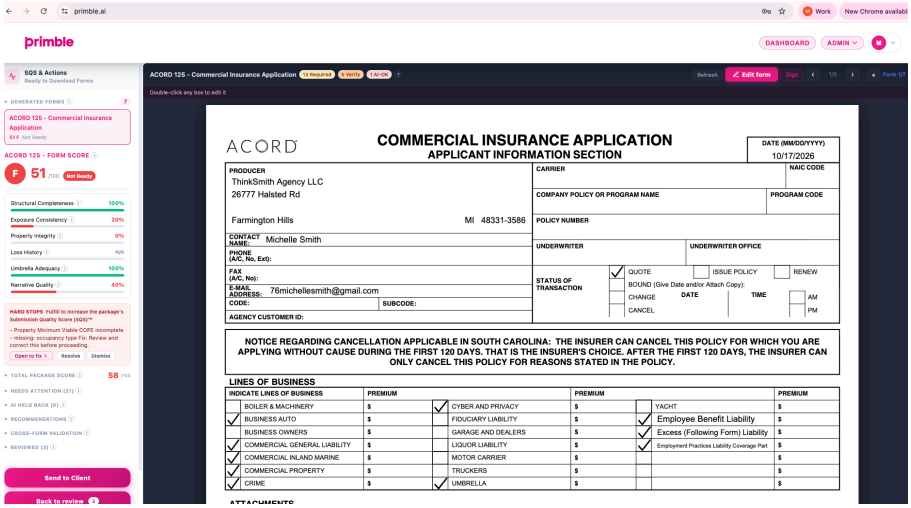

- Prefill verified information from uploaded documents.
- Do not assume the GL class code or rating basis from the operations description.
- Do not substitute WC class codes for GL codes.
- Allow producers to mark unknown information for follow-up rather than guess.
- Save each classification and its exposure amount separately for ACORD 126 mapping and SQS validation.
- Display only one GL correction item in the review workflow, with all missing GL details grouped inside it.

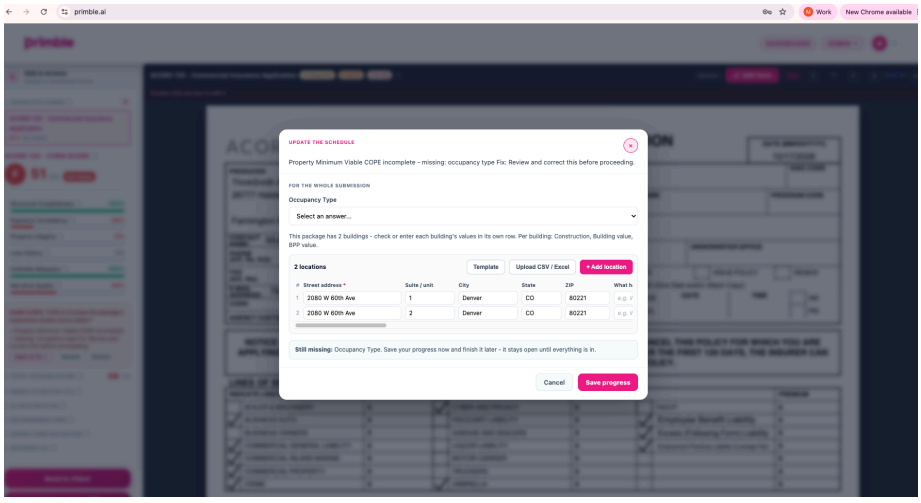

The objective is to eliminate two separate pop-ups and allow producers to complete all GL classification and rating exposure information in one place.

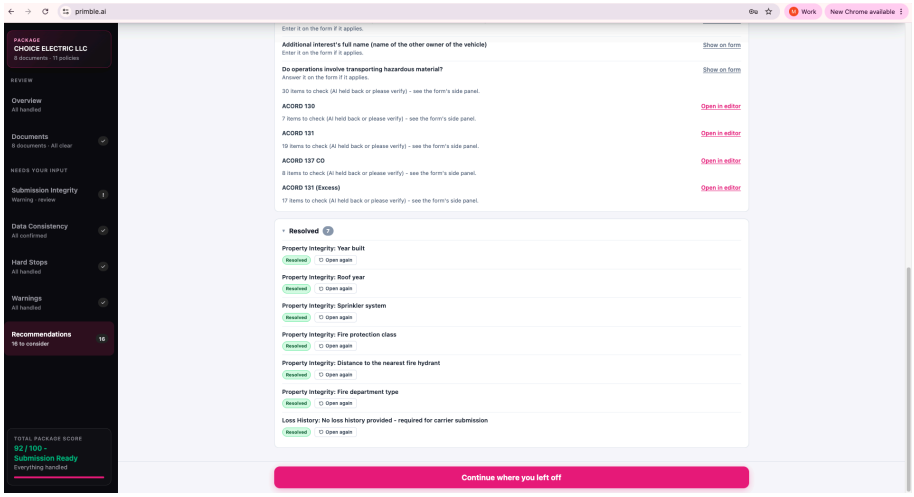

7. This is a bit confusing and I think it could be replaced by a Standardized Primble Narrative Form. Thoughts?

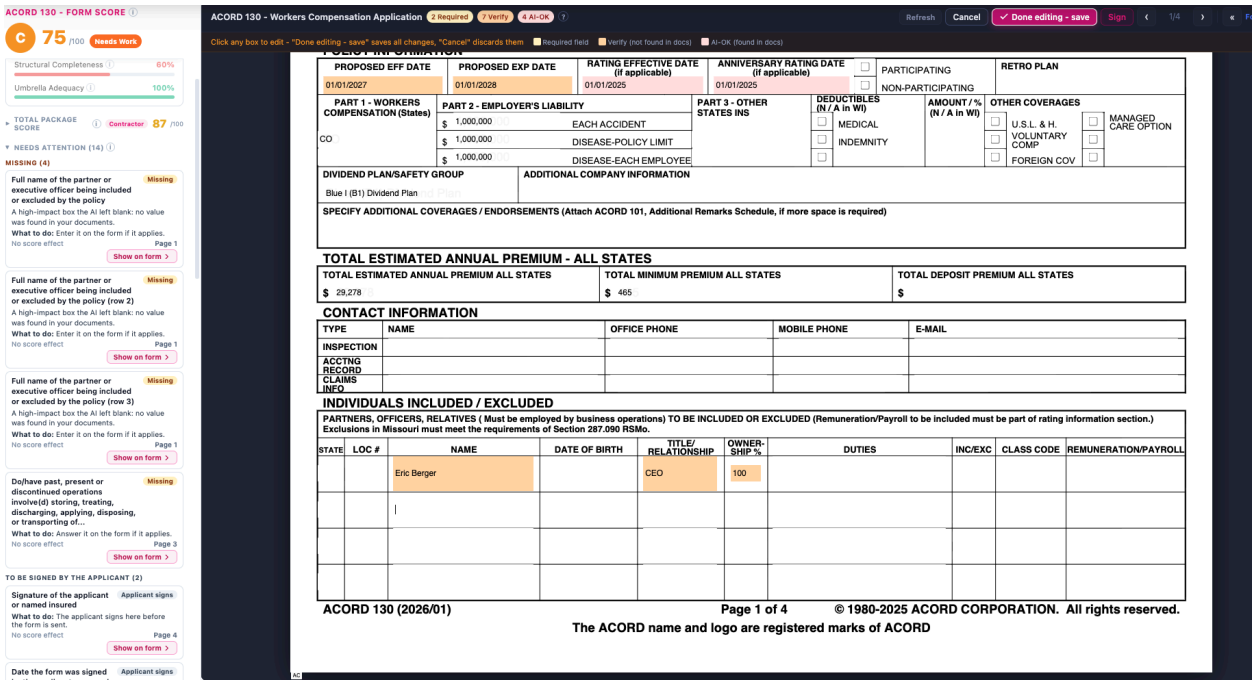

8. On the hard stop, it is asking for information twice. When I click “open to fix” on the Hard Stop, I had already put the year of bldg etc information in, and when I click “open to fix” it takes me back to update the schedule.

9. Repeat of Questions - full name etc:

10. SQS Review and Form Generation - found by going to “Downloads” and download “This Form”

This is definitely getting better, but still much for the end.

One thing I'm still trying to understand is why we're seeing 20 items to fix, 38 values to confirm, and another 84 values the AI held back at the very end. That's **A LOT** for a producer to review after going through the SQS process.

Wouldn't it make more sense to identify and address these items during the initial SQS review, before generating the ACORD forms, or even **during** the forms? I would also think the applicable items should be reflected in the score, with the score updating as information is confirmed or corrected.

If Primble has already accurately extracted information from the documents, we do not need the producer to confirm every value again. Ideally, we'd focus on what's missing, unclear or inconsistent.

On a positive note, I am seeing Primble catch some errors, particularly in the driver records, which is great! That's exactly the type of validation we want. But when I uploaded the Excel file it put the wrong information into the wrong lines.
